

AI-Based Expense Tracker with Analytics and Investment Recommendations

Abstract

Managing personal expenses effectively is important for maintaining financial stability and achieving future financial goals. However, many users find it difficult to track their daily spending, understand their spending patterns, and plan their savings. This project, AI-Based Expense Tracker with Analytics and Investment Recommendations, proposes a web-based application that helps users manage their income, expenses, budgets, and savings in a simple and organized manner. The system allows users to manually enter their income and expenses and categorize them into areas such as food, transportation, shopping, education, and bills. The collected data is analyzed to identify spending patterns, predict future expenses, and provide personalized suggestions for better financial management. Users can also set specific financial goals, such as buying a car or a laptop within a particular period. Based on their income, expenses, savings, goal amount, and risk preference, the system provides suitable investment suggestions such as Fixed Deposits, Mutual Funds, Gold, or Stocks. The application also provides graphical analytics, budget monitoring, overspending alerts, and savings recommendations to help users make better financial decisions. The system can be developed using Python, Flask, HTML, CSS, JavaScript, MySQL, and Scikit-learn for machine learning-based analysis. The proposed system aims to make personal finance management easier by combining expense tracking, data analytics, AI-based predictions, and goal-oriented financial recommendations in a single platform.
