ADEPS

AI-Driven Email Prioritization System Using Llama for Intelligent Email Management

Abstract

The rapid growth of email communication has made it increasingly challenging for users to efficiently manage and prioritize important message. Conventional email clients primarilyorganize emails chronologically, often requiring users to manually identify urgent communications, resulting in reduced productivity and delayed responses. This paper presents ADEPS (AI-Driven Email Prioritization System), an intelligent email management application that utilizes the Llama Large Language Model (LLM) to automatically analyze and prioritize emails based on their semantic content. The system securely retrieves emails through the Gmail API using Google OAuth 2.0 authentication and classifies them into four priority levels: Urgent, Important, Normal, and Spam. In addition, it generates concise summaries, extracts action items, identifies deadlines and meeting schedules, and provides professional reply suggestions to assist users in handling emails more efficiently. Developed using Python, Flask, SQLite, HTML, CSS, and JavaScript, the proposed system features a responsive web interface with advanced search and filtering capabilities . By combining Large Language Models with intelligent email analysis , ADEPS reduces manual effort, improves email organization, and enhances productivity, making it a practical solution for modern email management.

Keywords— Artificial Intelligence, Large Language Model (LLM), Llama, Email Prioritization, Gmail API, Flask, Natural Language Processing, Email Summarization, Intelligent Email Management.
